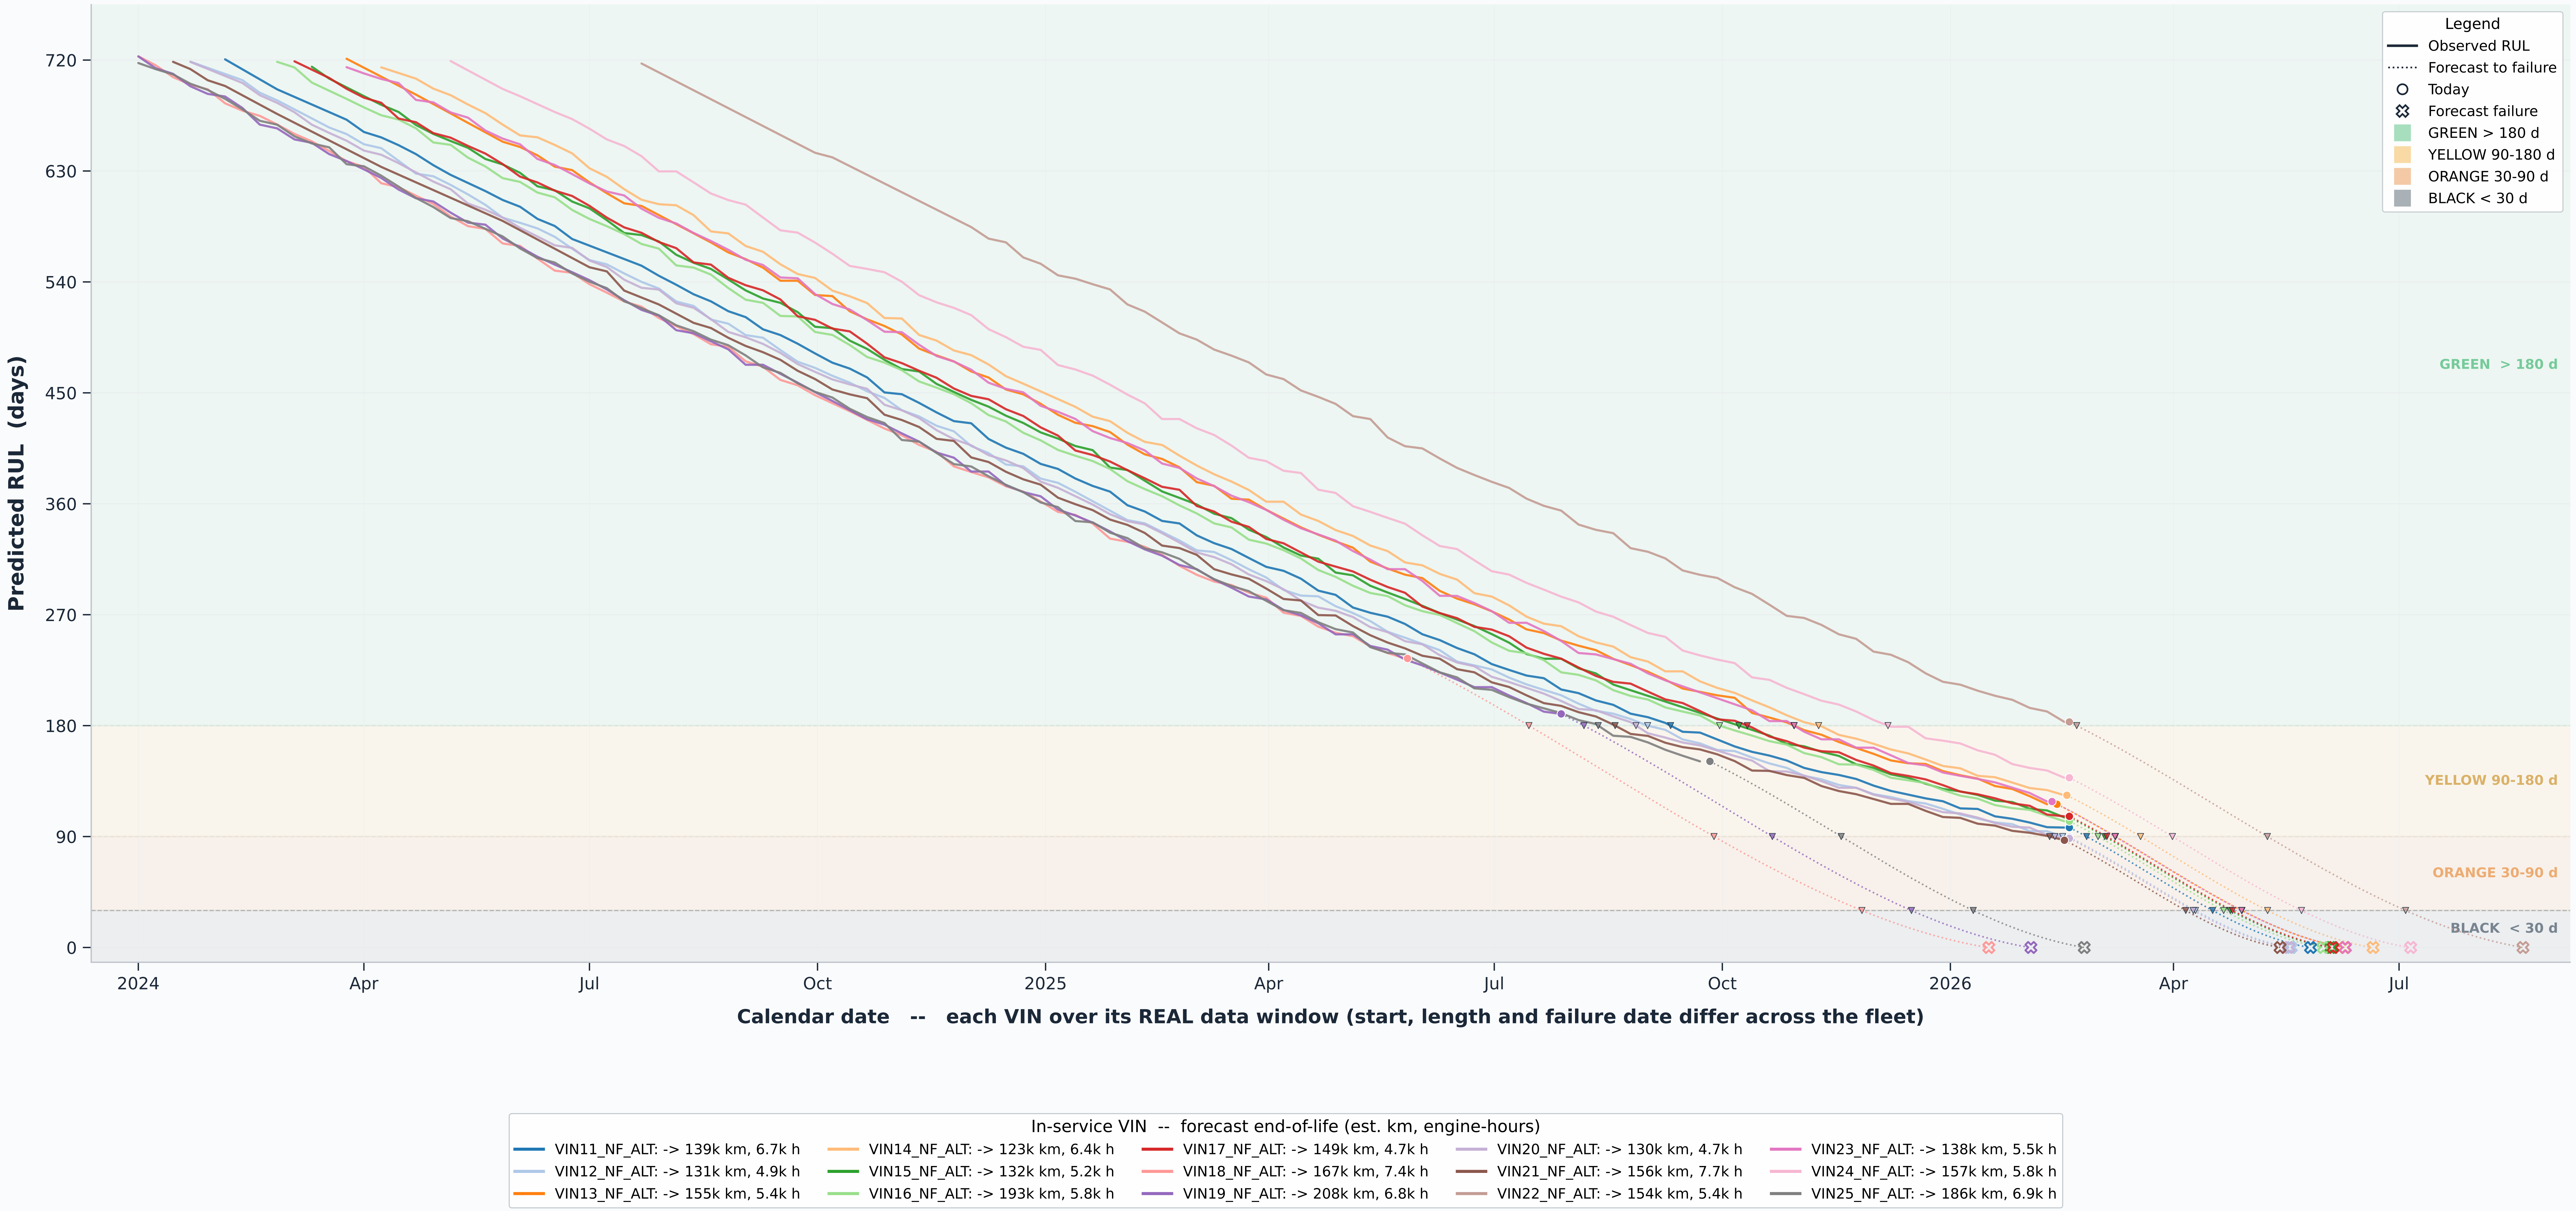
Alternator Fleet RUL Degradation -- IN-SERVICE Vehicles (n=15)

Solid = observed RUL over each real data window (o = today); dotted = fleet-posterior forecast to RUL=0 (open X). Legend gives each truck's forecast end-of-life km + engine-hours.



Each VIN on its REAL calendar window (no common day-0; start/length/failure date differ). RUL = fleet Weibull posterior median (n=10 events); per-truck timing not predictable (backtest 142d > 50d fleet clock). Legend shows each truck's real end-of-life est. km + engine-hours. Risk tier = STATIC classifier (AUROC 0.927 = which, not when).
