

Alternator Fleet RUL Degradation -- FAILED Vehicles (n=10)

Each line = one failed alternator over its real data window; X = realised failure (RUL=0). Fleet wear-out window = 578-652 d (median 601 d); legend gives each truck's end-of-life km + engine-h. V11.1: covariates NO_IMPROVEMENT — M0 (plain Weibull) ships.

Each VIN on its REAL calendar window (no common day-0; start/length/failure date differ). RUL = fleet Weibull posterior M0 (n=10 events, covariates NO_IMPROVEMENT); per-truck timing not predictable (backtest 140.4d > 49.7d fleet clock). Legend shows each truck's real end-of-life est. km + engine-hours. Risk tier = STATIC classifier (AUROC 0.927 = which, not when).

Daimler Alternator Failure Prediction | V11.1_ALT | GREEN >180d | YELLOW 90-180d | ORANGE 30-90d | BLACK <30d | Covariate verdict: NO_IMPROVEMENT (M0 ships) | Confidential
